TITLE: The spacing of supports with pin-type insulators for lines of 6 - 35 kV. (Rasstanovka opor so shtyrevymi izolyatorami dlya liniy 6 - 35 kV)

PERIODICAL: "Elektricheskiye Stantsii" (Power Stations), 1957, Vol.28, No.3, pp. 51 - 52 (U.S.S.R.)

ABSTRACT: In the design of transmission lines with pin type insulators the spacing of the supports depends on the profile of the line. It is usually supposed that the difference between span lengths should not be more than 10% on the assumption that when atmospheric conditions change the tensions in the wires in unequal adjacent spans will alter by different amounts which might weaken the poles or damage the conductors. This article provides an analysis of this question and shows that there is no risk in spacing wood or concrete poles with greater differences of span length such as are permissible when suspension insulators are used. This is most economical.

Calculations show that the greatest tension occurs at the minimum air temperature when the conductors were erected at a higher temperature. The preliminary calculations that are required in order to determine the differences of tension are stated. Particular cases are then considered such as two spans

Card 1/2

104-3-15/45

The spacing of supports with pin-type insulators for lines of 6 - 35 kV. (Cont.)

between anchor points, one longer than the other, three spans of gradually increasing length and so on. Diagrams showing the course and results of the calculations are drawn to scale and it is shown that the greatest difference of tension at the support is obtained when there are two spans, one of which is 1.5 to 2 times as long as the other and that even then with conductor AC-50 and region I climatic conditions the difference in tension is only 5 kg, which is negligible and which will not cause damage to the conductors, joints or supports.

ORG: Ural Chemical Machinery Plant (Uralkhimnashzavod).

TITLE: New guns for manual argon shielded arc welding of titanium articles

SOURCE: Avtomaticheskaya svarka, no. 9, 1966, 54-56

TOPIC TAGS: titanium, ~~welding~~, welding technology, welding equipment, welding gun, ~~argon shielded arc welding~~

ABSTRACT: Two guns for manual argon shielded arc welding of titanium have been developed. The salient feature of both guns is the gas-nozzle diameter (30—50 mm) which produces a wide laminar low-velocity gas stream extending up to 120 mm from the tip of the nozzle. Welding is performed with the argon flow directed against the direction of welding. The stream of argon spreads over the welded joint and adjacent hot zone, protecting them from oxidation. One gun (see Fig. 1) is equipped with automatic feed of the filler wire. It differs from standard guns in that the electrode (16) and gas nozzle (15) are separated: with the electrode in the vertical position, the gas enters the welding zone at an angle of 25—30°. Filler wire is fed automatically through the nozzle (14). The new welding guns simplify the process of welding titanium alloys and give adequate protection against

TITLE: Radio Building in China

PERIODICAL: Radio, 1959, Nr 5, p 60 (USSR)

ABSTRACT: The author reviews briefly the progress made in the development of the Chinese electronics and radio industry. This review is based on information from the periodical "Wu-hsien-tien". Experimental vhf broadcasts are conducted in Peking, which have a range of 60-70 km. The development of TV is emphasized. Besides Peking, TV stations were erected in Shanghai and in Harbin. In 1958, the Chinese radio industry started the production of the TV set "Peking" which resembles the Russian "Rubin" and "Znamya" TV sets. Mobile TV stations and other TV station equipment are manufactured in adequate quantity and quality. Besides the Peking Radio Plant, the Shanghai and Tientsin radio plants began the production of TV sets. The plant "Hsin-ping" is also mentioned.

ch'i-ts'ai started the production of over 100 different radio items. More than 70 models were shown at an exhibition of Chinese radio receivers in November 1958. The author mentions the following receivers: "Hsin-mao 506", "Mai-to 52A-A", "Hsin-shih-tai 104", "Mudan' 101", "563A", "562A" and others. The number of Chinese radio amateurs is growing constantly. In 1958, students of the Ching-hua university built a radiotelescope. Students of all faculties are trained in 90-hour courses at the Peking Radio Club.

TITLE: Experience with the mechanized argon-arc welding of vessels made of Kh18Ni10T steel

SOURCE: Svarochnoye proizvodstvo, no. 2, 1964, 9-11

TOPIC TAGS: welding, arc welding, argon arc welding, mechanized argon arc welding, steel welding, Kh18Ni10T steel welding

ABSTRACT: The article describes the technological aspects of mechanized argon-arc welding of vessels manufactured from Kh18Ni10T steel, as well as the design and construction of special-purpose rigs used in welding the sections and body of the pressure container. The vessel consists of three shells with a wall thickness of 3 mm and two elliptical bottoms 5 mm thick. Requirements of stability and resistance to intercrystalline corrosion are levied on both the base metal and the weld metal. The work had previously been done by manual arc welding with type EAl electrodes. As a result of tests, the decision was made to switch to a method of d-c reverse-polarity mechanized argon-arc welding with nonconsumable electrodes. The equipment and its technical characteristics are described. Arc current is said

Card 1/2

ACCESSION NR: AP4013290

to lie within 230 to 330 amperes, arc voltage from 8 to 15 volts (two separate beads laid from one side in one method and from two sides in another method). Arc length varies from 1 to 3 mm, with a welding rate of 7 to 25 m/hr. Filler wire diameter is 1.6-2 mm. Lanthanized tungsten (type VL-10) was used as the nonconsumable electrode, and welding wire Sv-06Kh19N9T as the deposit material. Special rigs are also described which were designed for the welding of the sections and body of the vessel to provide butt-welding of the seam, clamping against the copper backing, and displacement of the welding head along the seam. Orig. art. has: 1 table and 3 figures.

TITLE: Hermetic Sealing of the Scale-car Cabin (Germetizatsiya kabiny vagon-vesov)

PERIODICAL: Metallurg, 1958, Nr 2, pp 7 - 8 (USSR).

ABSTRACT: In spite of complete mechanisation of scale-car operation in the intake and weighing of charge materials, the adoption of hot-sinter charging at the imeni Dzerzhinskogo (imeni Dzerzhinskiy) Works made the driver's conditions uncomfortable. The authors describe a sealed and air-conditioned cabin, nine of which were installed at the Works in 1955-57 for operating with sinter at 400 - 450 °C). The cabin is provided with two windows on each side and the door (facing the bunkers) is also glazed. All controls are located inside the cabin, the layout being shown in Fig.1. The air entering the cabin is cleaned by passing over a water-sprayed coke filter resting on a steel grid over a tank (Fig.2) fixed to the main frame of the car. The tank water is sprayed on the coke with the aid of a type 700-40 pump and the tank has doors for periodical removal of the accumulated dust-sludge and addition of coke to the filter. A "Sirocco" Nr 4 fan passes the cleaned air at 18 - 20 °C into the cabin and maintains a pressure sufficient to prevent the ingress of dust. The adoption of this system is said to have improved blast-furnace operation as well as the scale-car

TITLE: Increasing the Durability of Cast Rolls (Povysheniye stoykosti litykh prokatnykh valkov)

PERIODICAL: Tr. Nauchno-tekhn. o-va chernoy metallurgii, 1956, Vol 10, pp 218-233

ABSTRACT: A qualitative study was made of steel and cast-iron rolls. The best operational properties were exhibited by rolls of hypereutectoid steel, because these wear less and with greater evenness. As a result of the "viscous" wear of hypoeutectoid and eutectoid steels the effective surface of the rolls quickly lost its smoothness and became covered with tiny protuberances, which only increased the wear. Hypereutectoid steel and cast iron exhibited a "brittle" wear. The smoothness of these rolls was restored, thereby holding the wear to a minimum. Greater use should be made of rolls made from alloyed and unalloyed steel with a 1.4-2.0 percent C content. Technical specifications must be worked out for them and the heat treatment improved, sand casting to be replaced by the exclusive

Card 1/2

137-58-2-2840

Increasing the Durability of Cast Rolls

use of metal molds or extremely thick cooling boxes (150-300mm). The choice of cast-iron rolls, which must be carefully made, should be guided by the specific conditions in which they are to be used. A classification of operating conditions is given for plate rolls and section rolls. Attention is given to the wear-resistant qualities of the chilled layer as these relate to various factors. Included are a performance curve for the rolls, recommendations concerning the chemical composition of the cast iron to be used, etc.

TITLE: The Production of Rolls with Cast Roll Passes (Proizvodstvo
valkov s litymi kalibrami)

PERIODICAL: Stal', 1957, no.7, pp. 663 - 665 (USSR).

ABSTRACT: The production of cast iron rolls with roll passes is
stated to be an established practice in the USSR. Superiority
of cast roll passes and the method of casting such rolls into
chill moulds as well as the method of casting chill moulds is
outlined and illustrated in Figs. 2 and 3. Low alloy and not
alloyed cast iron is used (chemical composition is given).
There are 3 figures and 3 Slavic references.

TITLE: All-Union Conference of Foundry Workers (Vsesoyuznoye soveshchaniye liteyshchikov)

PERIODICAL: Mashinostroitel', 1958, Nr 5, p 48 (USSR)

ABSTRACT: At the end of 1957, an All-Union conference took place in Moscow on scientific research in casting. After the plenary session the meeting broke up into the following 5 sections: iron casting, steel casting, technology of the casting form, non-ferrous casting, and equipment. A total of 45 reports were given. Representatives of the satellites also participated. V.M. Shestopal, Candidate of Technical Sciences (Giprostanok) reported on "The Latest in Projects of Foundry Shops and Plants". I.P. Yegorenkov, Candidate of Technical Sciences reported on "The Latest in Projects of Casting Machines". N.G. Girshovich, Professor and Doctor of Technical Sciences (LPI imeni Kalinin) reported on the important research work being accomplished in determining the continuity of solidification of castings. A.F. Landa, Professor, Yu.A. Litvintsev, Engineer and Florin of the Moskovskiy institut khimicheskogo mashinostroyeniye (Moscow Institut of Chemical Machine Build-

Card 1/3

ing) reported on increased corrosion resistance and heat resistance of high-test iron with ball-shaped graphite. A.Ye. Krivosheyev, Professor of the Dnepropetrovskiy metallurgicheskiy institut (Dnepropetrovsk Metallurgical Institute) reported on "The Crystallization of Chilled Iron". B.S. Mil'man, Candidate of Technical Sciences (TSNIITMASH) reported on "The Formation of Ball-Shaped Graphite and Prospects for Receiving High Test Iron". N.D. Titov, Candidate of Technical Sciences (Automobile Plant imeni Likhachev) reported on "Conveyor Mass Production at ZIL". G.I. Kletskin, Candidate of Technical Sciences (Stankolit) spoke on "Improvements of the Process of Melting Iron in Cupola Furnaces". A.V. Gel'perin, Candidate of Technical Sciences (NII TSKhM) reported on "Production of Crank Shafts for Tractor and Harvester Engines". I.N. Frolov, Engineer of the Barnaul'skiy kotel'nyy zavod (Barnaul Boiler Plant) reported on the centrifugal casting of important iron and steel parts. Ye.M. Baturin, Engineer, reported on "Risers in Exothermic Heat Treatment". N.Ya. Kogan, Engineer, (VPTI, GLAVNIIP at GOSPLAN USSR) reported on "A New Technology of Producing Large Castings in Mechanized

TITLE: Up-to-Date Methods in Producing Magnesium Master-Alloys

PERIODICAL: Liteynoye Proizvodstvo, 1959, Nr 7, pp 45-47 (USSR)

ABSTRACT: The preparation of industrial castings from magnesium cast iron with spheroidal graphite formation (spheroidal cast iron) requests an improvement of the cast iron processing method. So far the Mg-Alloy is produced by the consumer and according to different methods of production. It is urgently necessary to accomplish an immediate central production of Mg-alloys. Out of the many domestic and foreign patents in this field the silicon-Mg and the nickel-Mg alloys have found the widest propagation. The various methods described in the literature are uneconomic. During 1955/56 the Metallurgical Plant in Zaporozhyehad elaborated a

Card 1/2

SOV/128-59-7-23/25

Up-to-Date Methods in Producing Magnesium Master-Alloys

method for the central production of alloys (Liteynoye Proizvodstvo, 1956, Nr 3). This plant has produced 20 tons of Si-Mg alloy with a contents of 6 to 14% of magnesium. The "new" method suggested by the author D. Ye. Miklukhin and Belonsov L.A. (Liteynoye Proizvodstvo, 1958 Nr 5) is incorrect, too expensive, and, following this suggestion, it is not possible to produce alloys of equal value. The authors of this article suggest an improved method and do not agree with the quoted authors fighting a central production of alloys. The authors of this article request from GOST the elaboration of uniformly binding work specifications, but not based on the method suggested by Miklukhin and Belonsov. There are 2 diagrams and 9 Soviet references

TITLE: Perspectives for increasing the durability of working and idling
rolls of continuous thin-sheet mills

PERIODICAL: Referativnyy zhurnal, Metallurgiya, no. 7, 1960, 16, abstract 7D124
("Tr. Konferentsii: Tekhn. progress v tekhnol. prokatn. proiz-va".
Sverdlovsk, Metallurgizdat, 1960, 418-434)

TEXT: On the basis of observations carried out upon the operation of thin
sheet hot-rolling mills 1680 and 1450 it was established that in the stands 5-8
it is expedient to use two-layer working rolls made of medium alloy iron (2.6-3.2
pc Ni and 0.5-0.8 pc Cr) with working layer hardness 66-72 H_{sh} in the stands
9-10 - higher alloy iron (3.8-4.5 pc Ni and 0.8-1.0 pc Cr) and working layer
hardness 78 - 83 H_{sh}. For the stands 5-8 the rolls should be tempered at 180 -
250°C and for stands 9 - 10 at 100 - 150°C.

TITLE: The effect of modification on the structure and mechanical properties of cast steel being graphitized

PERIODICAL: Referativnyy zhurnal, Tekhnologiya mashinostroyeniya, no. 3, 1963, 6, abstract 3G42 ("Sb. nauchn. tr. Dnepropetr. metal-lurg. in-t", 1962, no. 49, 165 - 174)

TEXT: Modifying additions effectively affect the structure of cast and annealed graphitized steel. In the complex modification of steel by aluminum + calcium silicon + boron, the boron additions that are added for increasing the hardenability should not exceed 0.01%. Boron additions of more than 0.01% can only be recommended for castings whose ductility may be reduced at high demands made on their hardenability and wear resistance during operation.

Title : Development of television in the USSR

Periodical : Vest. Svyaz, 5, 6 - 8, May 1954

Abstract : The author states that during the last five-year plan, television became more popular and was improved in the USSR. A new, large television center in Kiev has been put into operation. Television centers are under construction in the following cities: Minsk, Riga, Sverdlovsk, Baku, Tashkent. Construction of television centers is planned at the following cities and towns: Talin (Revel), Gorkiy, Kuibyshev, and a few others.

Title : Developing the television network of the USSR

Periodical : Radio, 2, 32-33, F 1956

Abstract : The article reviews the first 5 years of television in the USSR and enumerates networks already in operation. The majority of these stations are equipped with standardized equipment and transmit pictures at a 5 kw and sound at a 2.5 kw capacity, although stations operating at a 15 kw and 7.5 kw capacity have already been established. Data on equipment, particularly tubes, are given. A good explanation of the networks' operations is presented.

107-5-34/54

4 TITLE: A Conference on Television (Konferentsiya po televideniyu)

PERIODICAL: Radio, 1956, Nr5, pp. 42-43 (USSR)

ABSTRACT: The second scientific and engineering Conference on television took place in Leningrad recently. Over 350 people took part in the Conference, among them "scientists and specialists" from Moscow, Leningrad, Kiyev, Gor'kiy, Kharkov, Odessa, Riga, Tallin, L'vov, Omsk and other cities. Exchange of experience in operation of tv broadcast stations was the main topic.

Reports on the prospects of tv broadcasts, the quality of reproduction, the transmitting tv tubes, ^{the} operating experience of tv stations, the exchange of tv programs and long-distance tv, and applications of tv in national economy were delivered.
the

In the engineer M.I. Krivosheyev's report "The Prospects of TV Broadcasting in the USSR" the directives of the 20th Party Congress were cited. In the 6th Five-Year Plan the number of tv broadcast stations is to be brought to 75 as compared to the existing 12. The tv stations are being built in Stalino, Vilnius, Tbilisi, Yerevan, Stalinabad and other cities. Particularly large tv centers are planned for Moscow and Leningrad with 80/40 kw in antenna, the tower height up to 300 m, and the number of studios 11.

Card 1/4

A Conference on Television

107-5-34/54

Engineer Ya. I. Efrussi delivered a report on "The Ways to Improve the Quality of Black-and-White Television". He noted the distortions inserted by the vestigial sideband system of tv transmission; also by various defects in the scanning systems. 15 to 20% of nonlinearity in scanning is usually tolerated; but this is inadmissible from the standpoint of quality of the picture. Decisions taken on this report call for working out of standards on linear and nonlinear tv distortions from various causes.

Engineer A.I. Shchipkov delivered the report "Brilliance Fidelity in the Black-and-White Television". He noted that in case of artistic tv broadcasts a correct relation between the brilliances of the spot-light objects and the background must be preserved rather than absolute values of the brilliances. For a correct reproduction of brilliance contrasts all nonlinearities of the individual elements of a tv system should be adequately compensated.

Engineers A.B. Alekseyeva and Ye.M. Ponomareva delivered reports on tv transmission tubes 1M-7 and 1M-17 giving their basic data, operative peculiarities and methods of improvements. These types are mostly used in Soviet tv transmitting equipment. Their service life characteristics are too diversified, they often have black spots on the screen and other defects. The conference decided to ask MINT to develop better tubes operating at 300-lux illumination.
